

## ABSTRACT

A method and system manage access to services. Permission relating to the services is delegated over an ad hoc network in a personal area network. The permission is represented using a digital signature. Access to the services is provided to each permitted delegatee over a second computer network that is different from the personal area network.

1. A method for managing access to services, comprising:  
2. delegating permission relating to the services over an ad hoc network in a personal area network;  
3. representing the permission using a digital signature;  
4. providing access to the services to each permitted delegatee over a second computer network that is different from the personal area network.
